HIV/AIDS Among People Over Age 50

National

- Through 2004, 14% of all reported HIV/AIDS cases in the United States were among people over age 50.¹
- From 1990 to 2001, the number of AIDS cases among people over age 50 increased more than fivefold, from 16,288 cases to 90,513 cases.²
- Before 1985, 17% of older adult cases were caused by contaminated blood products.³
- Heterosexual transmission of HIV is the leading mode of transmission among people over age 50, led in part by the availability of erectile dysfunction remedies.⁴
- In 2003, 52% of older Americans living with HIV/AIDS were either Black or Hispanic.⁵

Illinois

- In 2004, 12% of people living with AIDS in Illinois were over the age of 50.⁶
- Through 2004, men comprised 86% of the 4470 AIDS cases in people over the age of 50.⁷
- Through 2004, African Americans were the largest racial/ethnic group of reported HIV/AIDS cases over 50, (approximately 50%), followed by Whites (approximately 30-40%) and then Hispanic (approximately 10%).⁸
- Through 2004, risk factors for older adults include: Men having Sex with Men (approximately 30-40%), injection drug use (approximately 25-30%), and heterosexual sex (approximately 10-15%).⁹

Chicago

- As of March 31, 2005, there is an estimated 4,468 individuals over the age of 50, 23.8% of the total 18,739, living with HIV and AIDS in Chicago.¹⁰
- Of the total 4,468, approximately 82% (3,684) are males and approximately 18% (784) are females.¹¹
- In 2003, the leading mode of transmission among males over age 50 was men having sex with men (38%) followed by injection drug use (33%).¹²
- In 2003, the leading mode of transmission among females over the age of 50 was injection drug use (39%), followed by heterosexual sex (35%).¹³
Remember

- Older adults may be sexually active.
- Older adults are less likely to use protection because need to avoid of and fear of pregnancy is not an issue post menopause.
- Older adults may use injection drugs.
- Older adults who are exposed to HIV are at greater risk than younger people because of weakened immune systems due to ageing.
- Health providers may not screen older adults for sexually transmitted diseases or injection drug use due to lack of training or ageist attitudes.
- Older adults are often not diagnosed properly as having HIV/AIDS because many of the symptoms resemble the symptoms of old age.
- Older adults are frequently left out of HIV/AIDS research, drug trials and educational prevention programs.
